

# Presenting my project

Speech

**Students:** Owen Jesús Enríquez Ascencio 19310147  
Jonathan Guillermo Díaz Magallanes 19310153  
Miguel Sosa Guardado 19310166  
Juan Pablo Cruz Martínez 19310167

**Class:** English

**Teacher:** Irma de Jesús Miguel Garzón

# **Our project**

## **Presentation**

Hi, we have come to present to you SAI, our information management system, which is a modular platform that involves all the information the CECAM produces regarding the social service, professional practices and surveys done. Our team is composed of Miguel, Owen, Juan and me, Jonathan.

## **What is the project about?**

This project consists in the creation of a platform that efficient the CECAM area, for this, the platform will be able to digitize all the information that this area can create, like the personal data of the social service and professional practices crew, also this platform will be able to facilitate the interactions between the staff and the crew and can automate some common tasks, like the application of the satisfaction surveys to the visitants.

## **Who are the stakeholders?**

This is focused to the CECAM or Centro de Educación y Cultura Ambiental Metropolitana, The AMBU or known as well as Agencia Metropolitana de Bosques Urbanos and the social service crew.

## **Why are we doing this?**

SAI seeks to optimize tasks that are still carried out on paper, avoiding the excessive waste of sheets, in addition to digitizing all the information that is generated within the area in a better and faster way than it is currently done.

## **What are we going to do?**

Each person is going to be in charge of different tasks. Miguel is the product owner, Juan is the scrum master, Owen is the backend developer and I am the frontend developer.

## **What do we currently have?**

As we currently are working on this project, the comeouts that we got is the starter documentation, like the project charter and the initial phases of SCRUM methodology, where it includes the product backlog and the planning of the sprints.

## **Ours milestones**

We have ten milestones in the project, they are the conception of the idea, beginning of the documentation, exposition of the presentation, start of the planning, closure of the documentation, start of the development, conclusion of the development, beginning testing phase, conclusion of testing phase and the display of the final product.

## **AR or VR usage**

The reason why we decided not using VR/AR is because it's not necessary at all, the main idea is digitized process in order to be more efficient and the VR/AR has nothing to do with that.

## **Conclusions**

**Jonathan Guillermo Díaz Magallanes** : The development of this project has two main objectives; creating a system that involves all the knowledge we obtained throughout the degree and obtaining a functional system that can be used by our clients.

**Miguel Sosa Guardado** : I think this project is useful because we are trying to modernize the CECAM area, transferring all their physical information into a digital format, making it more accessible for the users and promoting the stop using sheets of paper.

**Juan Pablo Cruz Martínez** : With this system we fix the problems that are in the CECAM area about the control of the assistance and hours of social services members and the organization of the events.

Owen Jesús Enríquez Ascencio : SAI is the best solution to digitized CECAM's tasks, thus facilitating processes such as the social service section or the organization of events by the forest, therefore, it is time to make the forest more efficient through technology. Thanks.
